SENTRY AI

Supplier disruption decisions you can explain

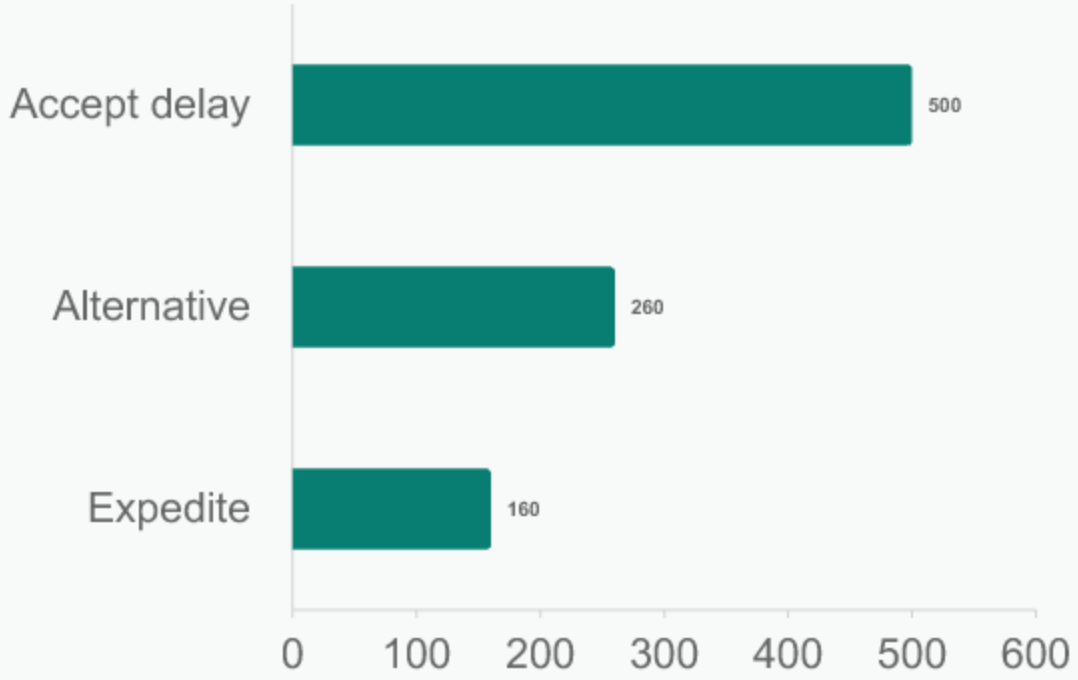

Evidence-backed recovery with Zetaris, Nightshift and H-MEM

Open Agent Hackathon 2026 / The Agent That Can Explain Why

One delayed shipment, three recovery choices

Alpha delayed five days

Stock covers the first order.
ORD-1002 remains exposed.
Five late days cost GBP 500.

GBP 340 hypothetical saving against taking no action

Agents exchange evidence and challenge conclusions

Evidence gaps return to the Planner

Rejected drafts carry reasons. Current evidence overrides recalled memory.
Only a validated recommendation is stored and offered for human review.

Zetaris connects the operational evidence

PostgreSQL ERP: customer orders and penalties

Supplier CSV portal: replenishment, stock and recovery offers

Carrier CSV source: arrival claims, timestamps and freshness

One bounded, read-only investigation snapshot

Query IDs, row counts, evidence references and acquisition timestamps remain attached to the decision packet.

The best choice changes with the conditions

Scenario	Calculated outcome	Operational implication
Alpha +5 days	Expedite: GBP 160	Lower cost than GBP 260 alternative
Alpha +7 days	Alternative: GBP 260	Expediting is no longer cheapest
Budget GBP 50, zero late days	No feasible recovery	Escalate constraints for human review

Why this option? Why not the others? What would change it?

Memory stays useful when the facts change

Recall related findings with their provenance

Recalculate current costs and challenge stale recommendations

Record feedback and conflicts in the H-MEM trust ledger

Withhold a firm answer when current source reports disagree

Measured behavior and honest failures

180 backend tests passed; 3 live tests are opt-in

21 browser cases cover compatibility and the enhanced workflow

Selected model: Qwen2.5-Coder 3B Q4_K_M

Selection evidence: 9/9 expected outcomes, 5.913s median; 7B: 8/9, 11.773s

Live source queries and model receipts are retained for review

A reviewable prototype with clear boundaries

Local Qwen inference accelerated by NVIDIA CUDA on RTX 4080

Synthetic records, exact GBP costs and three fixed recovery policies

Human review and portable JSON/Markdown decision packets

No automatic purchases, production deployment or customer savings claim

Built with Zetaris, Nightshift, H-MEM, Codex and VS Code
